

MATalogs Internship — Day 5 Task Completion Report Submitted by: Hafiz Ahmad Raza

Project: Automated Student Registration Pipeline

Tools: Google Forms & Sheets, n8n, Notion, Slack

Overview

An automated workflow designed to capture student registrations, store structured records in Notion, and dispatch real-time team notifications via Slack.

Workflow Architecture

Google Form/Sheet → n8n Trigger → Notion Database Entry → Slack Webhook Alert

- **Google Sheets Trigger:** Listens for new form submissions (Full Name, Email, Course).
- **Notion Action:** Dynamically creates a new record in the Student Registration database with status New.
- **Slack Action:** Sends a formatted POST request via HTTP Request Webhook to #n8n-alerts.

Key Technical Learnings

- Building event-driven automation pipelines in n8n.
- Mapping dynamic JSON variables across multiple API schemas.
- Resolving OAuth permission constraints using HTTP Request Webhooks.
- Configuring dynamic database fields and data types in Notion.

Deliverables Checklist

-  **Workflow JSON Export:** End-to-end n8n workflow file.
-  **Google Form & Sheet Screenshot:** Raw entry response logs.
-  **Notion Database Screenshot:** Auto-populated student record.
-  **Slack Alert Screenshot:** Formatted message delivered to channel.
-  **n8n Canvas Screenshot:** Execution view with all nodes green.

Status: Task Completed Successfully
